

Burns

1. When (if ever) do you open blisters in acute burns?
2. When do you transfer patients to a burn center vs. outpatient follow up? How do you arrange that follow up and for when?
3. What topical medications do you put on burns and which ones do you avoid?
4. How do you fluid resuscitate your dialysis, heart failure, and volume sensitive/overloaded patients? Do you still use the Parkland formula, or do you use other guidelines to help you?
